(57) Abstract: The invention is relative to a stent 1 with a tubular support frame 2 consisting of axially successively following, interconnected annular segments 3, 4, 5, which support frame 2 is surrounded on its outside by a thread 11. The thread ends 12, 13, are guided via a deflection 14 from the outside into support frame 2, where they are coupled by a connector consisting of a material visible in x-rays. Deflection 14 is realized by two deflection elements 15, 16 in the form of eyelets provided on annular segment 3. Deflection elements 15, 16 are arranged on the circumference of support frame 2 at an interval from one another and are provided on end-side annular segment 3, viewed in longitudinal direction L of the stent.
